mezodot

A money market for MUSD and MEZO on Mezo.

Supply to earn. Borrow against BTC, your supply, or collateral locked on other chains. Open a Mezo trove and put its MUSD to work in one transaction.

Track	1, DeFi
Status	Live on Mezo testnet, not audited
Team	MDLOG Labs
Submitted	Wave 2, November 2026

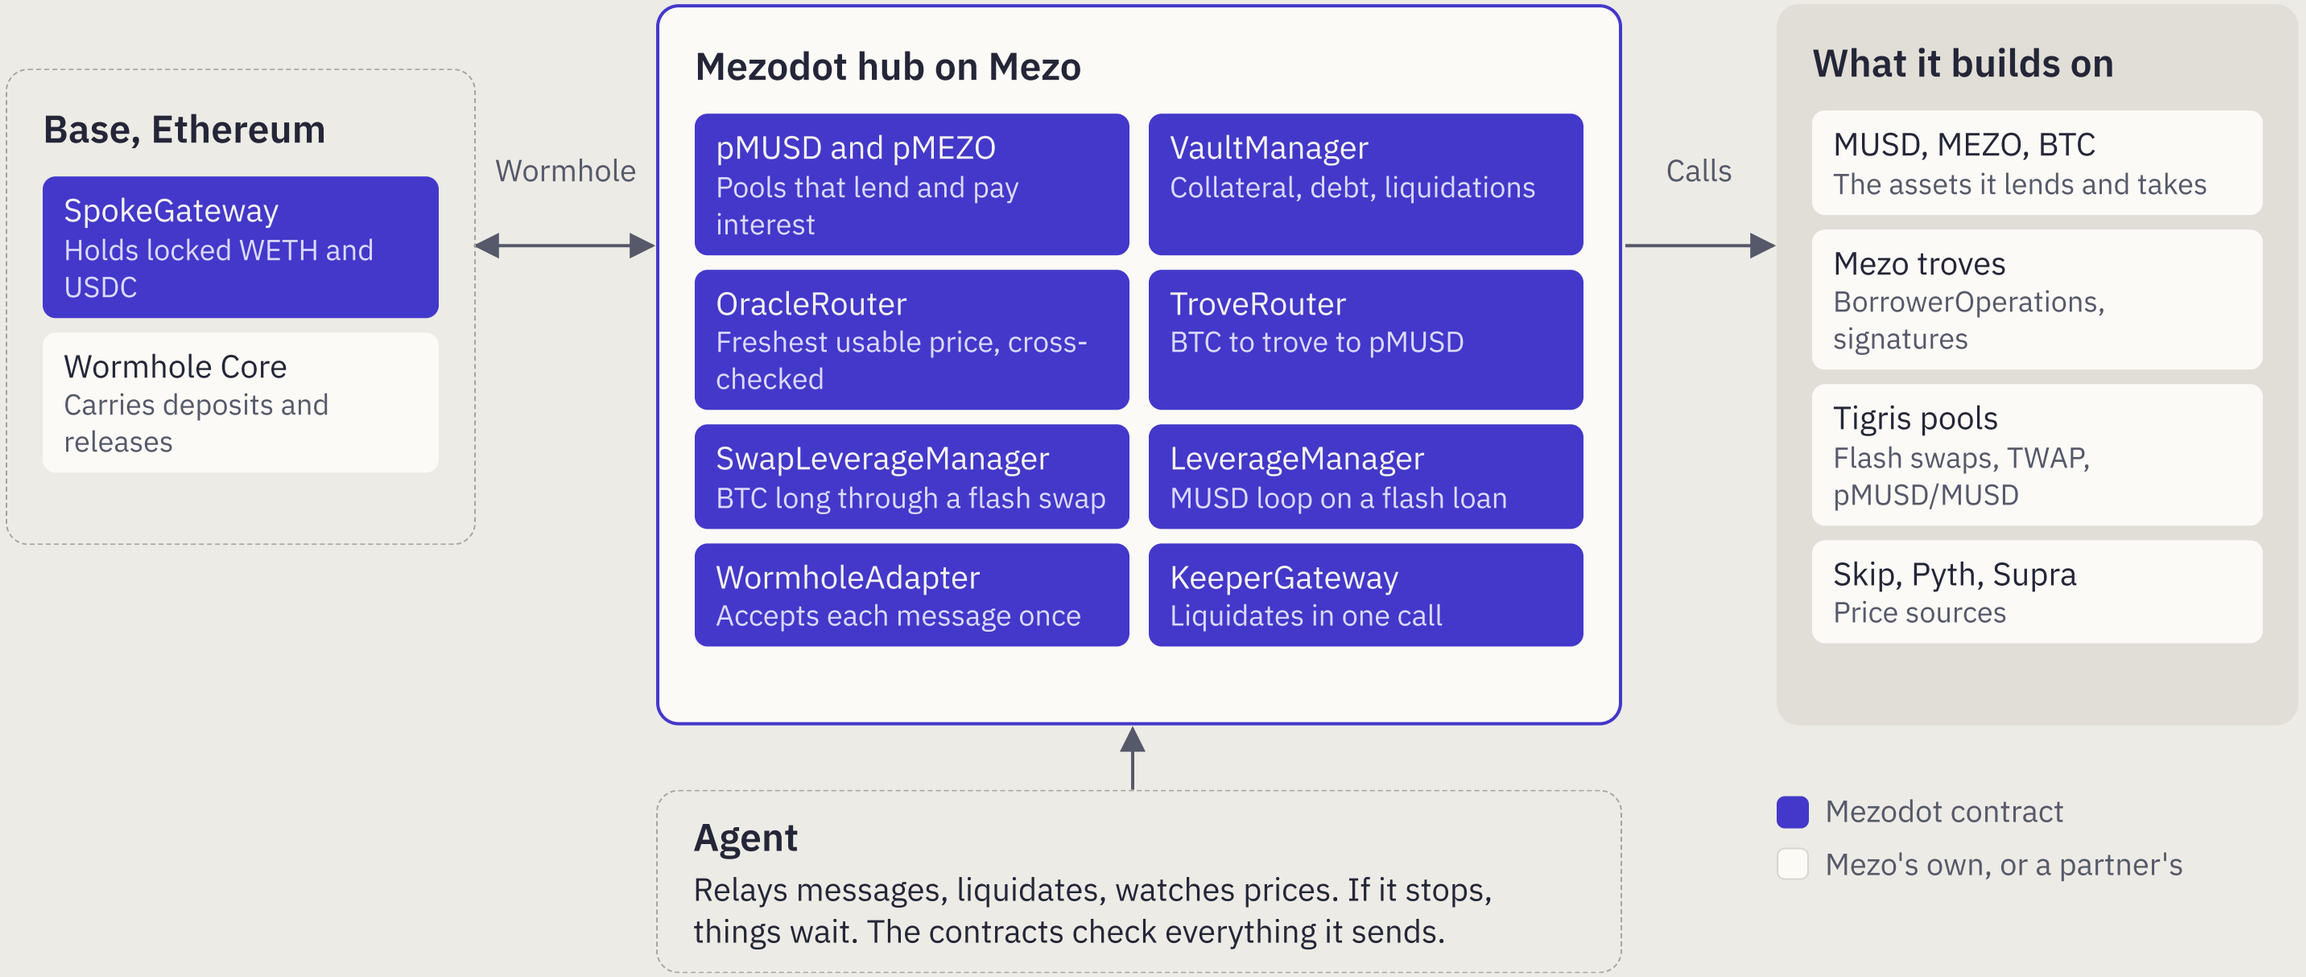

Mezo gets BTC holders to MUSD. Then the MUSD needs somewhere to go.

If you	On Mezodot you can
are about to mint MUSD in a trove	open the trove and supply what it mints in one transaction. Later, repay or close the trove from that supply.
hold MUSD or MEZO	lend it to borrowers. The receipt, pMUSD or pMEZO, keeps earning while you use it as collateral, and MUSD can be looped in one click.
hold BTC and want more of it	open a long in one transaction. A Tigris flash swap buys the BTC, and your loan pays the pool back.
hold WETH or USDC on Base or Ethereum	lock it where it is and borrow on Mezo. The asset stays on its chain, and only a message crosses.

Mezodot earns when these loans pay interest. Page 8 shows who pays and how much.

Mezo is the hub. Other chains only lock collateral.

New in Wave 2: BTC opens a Mezo trove and supplies pMUSD in one transaction.

You post 0.05 BTC, worth $3,851 at $77,028

The trove owes 2,202 MUSD, about 175% covered

200 gas compensation, which returns when you close, and a 2 MUSD borrowing fee.

You hold 2,000 MUSD of pMUSD, which earns the pool's supply rate

Closing burns 2,002 MUSD plus interest. Your supply covers 2,000, so you add a little MUSD on top.

Where it stands

- **Ran on testnet.** Open, repay and close used these same amounts. All the BTC came back, for a net cost of about 2 MUSD.

Does it pay?

Not yet. A trove costs 1% a year. pMUSD pays more than that above about 39% utilisation, and pays 0.03% at today's 7%. The page shows both rates.

Mezo's rules stay in force

1,800 MUSD minimum net debt, 150% system ratio to open, no closing in Recovery Mode. EOA wallets only, because Mezo checks plain ECDSA.

Mezodot acts on Mezo's own contracts, not just its tokens.

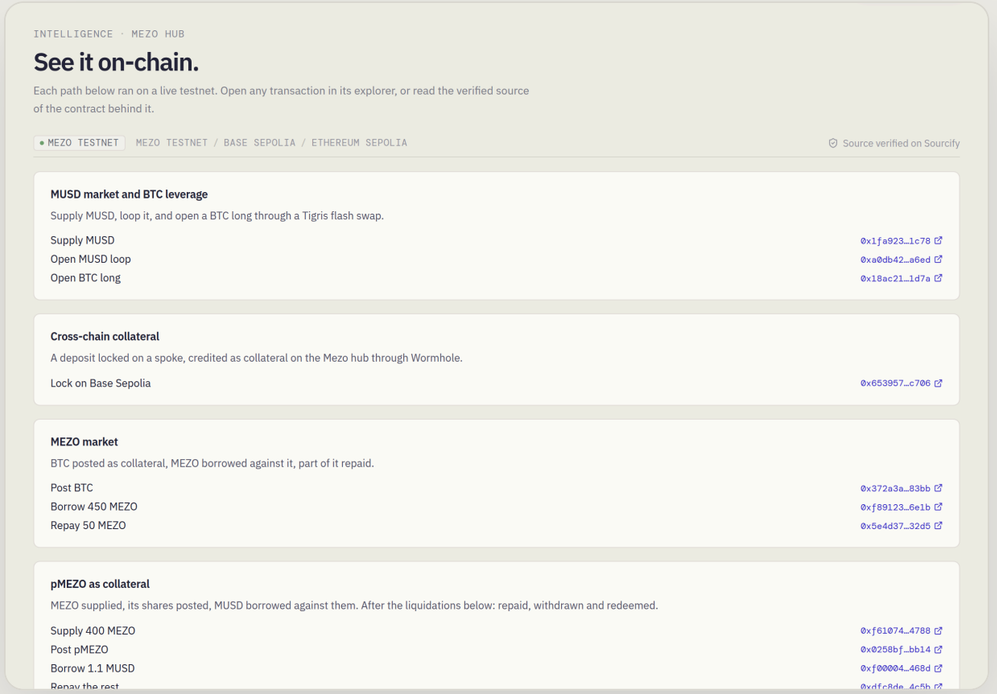

Mezo primitive	What Mezodot does with it	On testnet
MUSD and MEZO	Pool assets: supplied and borrowed, with MUSD also looped	● Exercised
BTC precompile	Hub collateral, and the asset in the one-transaction long	● Exercised
Troves, via BorrowerOperations	Opened, repaid and closed for a borrower with their signed message	● Exercised
Tigris MUSD/BTC pool	Flash swap for BTC longs, and a TWAP that backs up MUSD's price	● Exercised, live
Tigris stable pool	New pMUSD/MUSD pool: an exit when the market has no idle cash	● Live, 40 of each
Skip BTC/USD precompile	BTC's first price source, with no key. Mezo's troves read the same feed	● Live since 4 Nov
Pyth push on Mezo	Prices for MUSD, MEZO and USDC, refreshed hourly by Mezo	● Live
Wormhole Core on Mezo	Cross-chain collateral from Base and Ethereum	● Exercised
Mezo Passport	Bitcoin wallets connect through Mezo smart accounts	● In the app

Each path below ran on testnet. Click one and check it.

Trove opened and supplied	0xac10d6…1e6c
BTC long through Tigris	0x18ac21…1d7a
Lock on Base Sepolia	0x653957…c706
Borrow 450 MEZO	0xf89123…6e1b
Borrow against pMEZO	0xf00004…468d
Keeper liquidation	0x8e4d1c…c3ca

The full list is 34 transactions at docs/EVIDENCE.md and in the app. All 15 hub contracts are verified on Mezo's explorer, and `pnpm verify:deployment` runs 294 read-only checks against the live chain.

The liquidations were staged. The owner lowered pMEZO's limits for about 8 minutes so a real position fell below a health factor of 1. The agent found and liquidated it unprompted. Every wallet on this list is ours.

Since Wave 1: what the judges asked for, and what happened.

Asked for	Done	Status
pMEZO collateral, MEZO borrows, keeper liquidations on-chain	All three ran on testnet, with transactions on page 6	● Done
Troves through BorrowerOperations	TroveRouter and a page in the app. Open, repay and close ran on testnet	● Done
pMUSD/MUSD liquidity in Mezo Pools	A stable Tigris pool, seeded with about 40 of each	● Done, small
Close the MUSD and MEZO price gap	Tigris TWAP behind both. MEZO's pool is too far off to use yet, so it returns no price	● MUSD done, MEZO waits
Spokes and the lock easy to verify	A proof page in the app, and all 15 hub contracts verified on Mezo's explorer	● Done
veMEZO and gauge incentives	Left out of this wave	● Not started

Promised in Wave 1, moved to December: timelock and multisig ownership, and a static build of the app.

Who pays: borrowers, flash borrowers and liquidated accounts.

Who	What they pay	Protocol's share
Borrowers	Interest set by pool utilisation	10% of interest, capped at 30%
Flash borrowers, loops	0.09% of each flash loan	All of it, into reserves
Liquidated accounts	A 5% to 10% bonus to the liquidator	10% of the bonus, capped at 50%

Example, $1M of MUSD borrowed at 80% utilisation: 6% a year is $60,000 of interest.

Earned so far, on testnet: $0.06 in reserves and under $0.01 of treasury collateral, because these are test amounts. At launch the protocol's income depends on borrowers it does not have yet.

What is not done, and when it should be.

Not done

No confirmed outside users. Every wallet on page 6 is ours. Tester guide: docs/TESTING.md

No audit. Unaudited contracts, on testnet only.

One owner key. It can change risk limits with no delay until the timelock arrives.

MEZO has one live price. If Mezo's push stops, MEZO borrows and liquidations revert until it returns.

The live demo is a dev server, so a first load can be slow.

Plan

- **By 12 November 2026**
  Outside testers.
- **December 2026**
  Static build. Timelock and multisig. MEZO price fallback in service.
- **First quarter of 2027**
  External audit, then mainnet with capped markets.

The later dates are plans, not commitments.
